GAINS-Asia: Greenhouse gas – Air pollution Interactions and Synergies

A scientific model designed to identify the most viable and cost-effective methods of jointly reducing emissions of air pollution and greenhouse gases in Asia, without compromising economic development.

A project funded by the
EU 6th Framework Programme for Research

GAINS: GHG-Air pollution INteractions and Synergies

A new tool to analyze synergies between air pollution and GHGs

- Focus on cost-effective emission control strategies to improve air quality with maximum co-benefits on GHG emissions.
- Extension of IIASA's RAINS integrated assessment model for air pollution to GHGs
- GAINS covers SO_2 , NO_x , PM, NH_3 , VOC and CO_2 , CH_4 , N_2O , (HFC, CFC, SF_6)
- Implementation for Europe completed and used for policy analysis by the EU
- Implementation for India and China is near completion

The GAINS model: The RAINS multi-pollutant/ multi-effect framework extended to GHGs

	PM	SO ₂	NO _x	VOC	NH ₃	CO ₂	CH ₄	N ₂ O	HFCs PFCs SF ₆
Health impacts:									
PM	√	√	√	√	√				
O ₃			√	√			√		
Vegetation damage:									
O ₃			√	√			√		
Acidification		√	√		√				
Eutrophication			√		√				
Radiative forcing:									
- direct						√	√	√	√
- via aerosols	√	√	√	√	√				
- via OH			√	√			√		

TM 5 model set-up

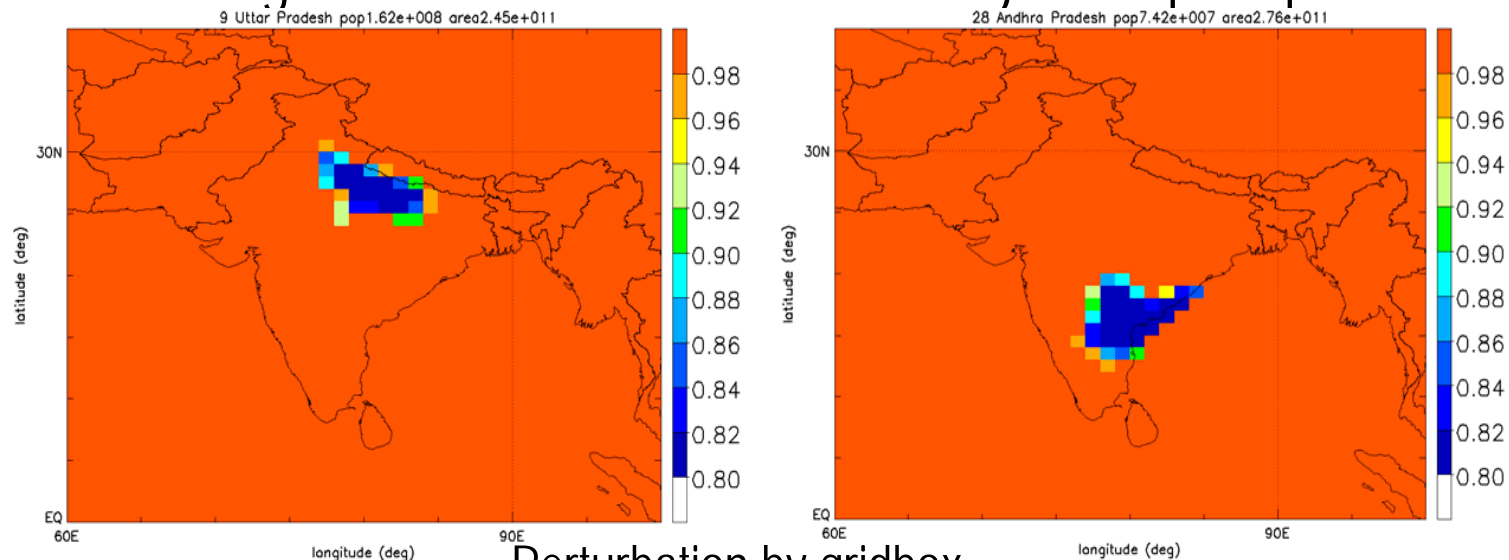

TM5 is a global 3D CTM with regional two-way nesting, developed by Utrecht University and JRC

- For GAINS-Asia operated by JRC
- $6^\circ \times 4^\circ$; $3^\circ \times 2^\circ$, $1^\circ \times 1^\circ$; 25 vertical layers
- Aerosol and photo-chemistry
- ECMWF meteorology; output every hour
- Participated in AEROCOM, PHOTOCOMP, HTAP intercomparisons

Source-receptor relationships derived for:

- 26 regions in China
- 32 regions for India; Bangladesh, Pakistan and Sri Lanka
- Perturbation by -20 % of anthropogenic emissions per region
- Emissions: GAINS/EDGAR3.2; BC/POM: Bond (2004).
- 2 separate cases: NO_x-BC-POM; and SO₂-CO-VOC
- Altogether ca. 120 simulations of 1 year+ spin-up 2 months

Perturbation by gridbox

- Observations show that diurnal and daily variabilities of RN222 and PM concentrations are correlated

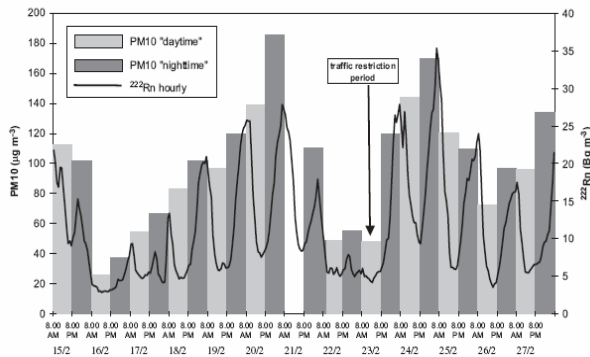

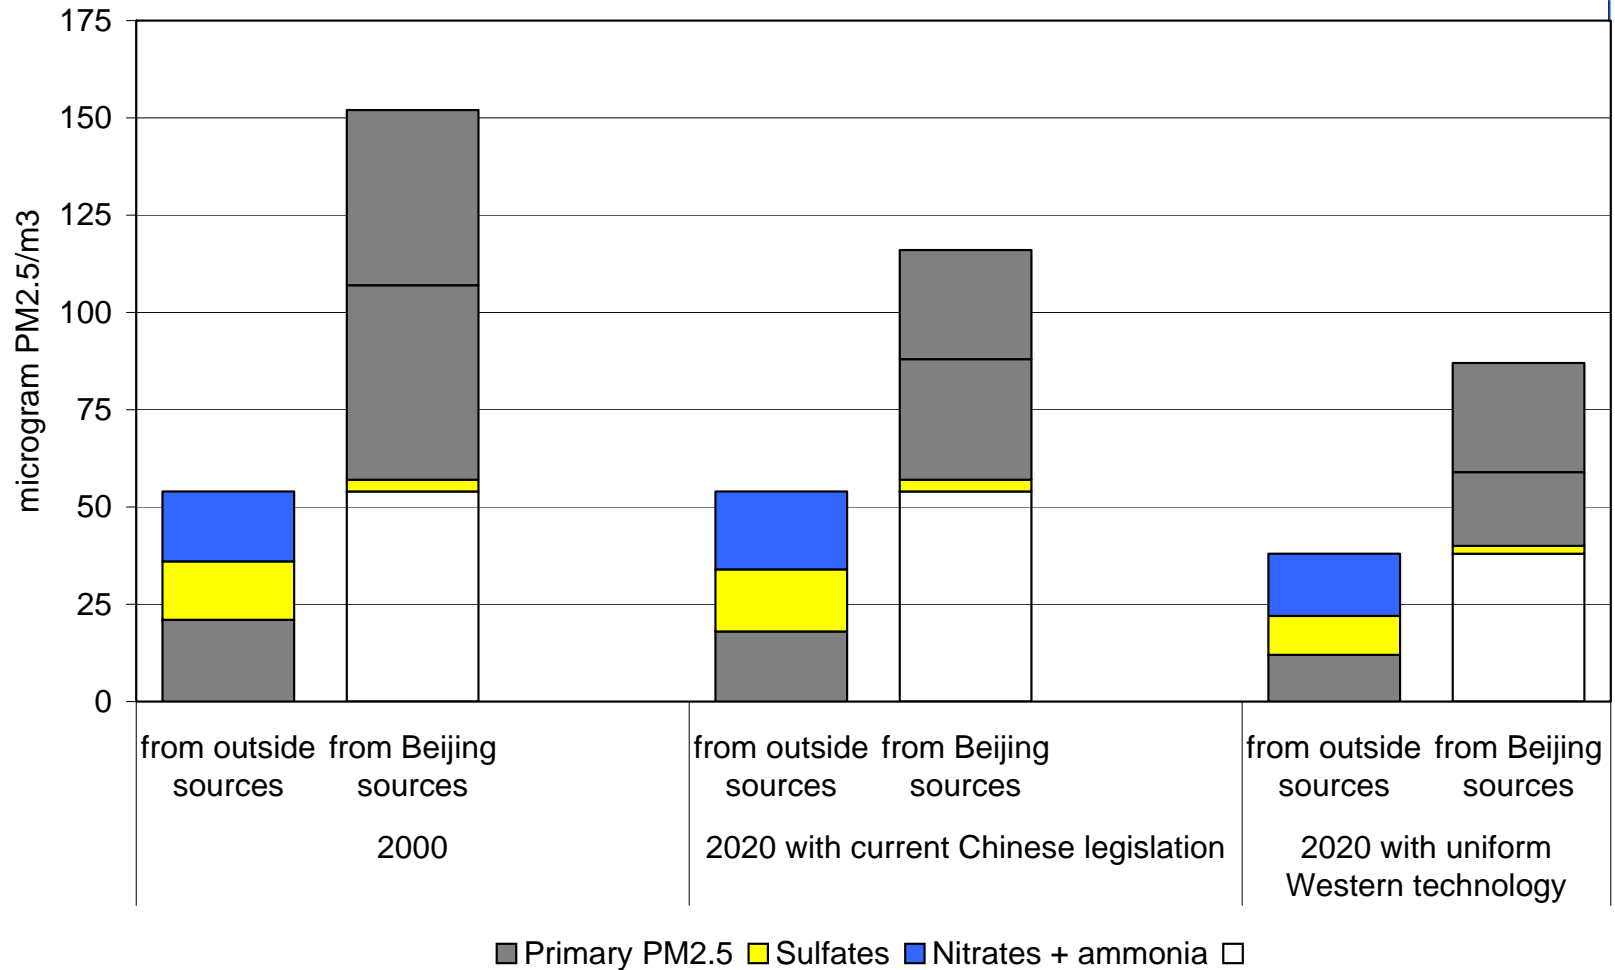

Fig. 1. PM10 concentrations (light grey, daytime; dark grey, nighttime) together with hourly ²²²Rn concentration (solid line) represented for the period 15-27 February 2003.

Correlation of particles and Rn222
in Milano, Italy (Vecchi et al,
Atmos. Env., 2005)

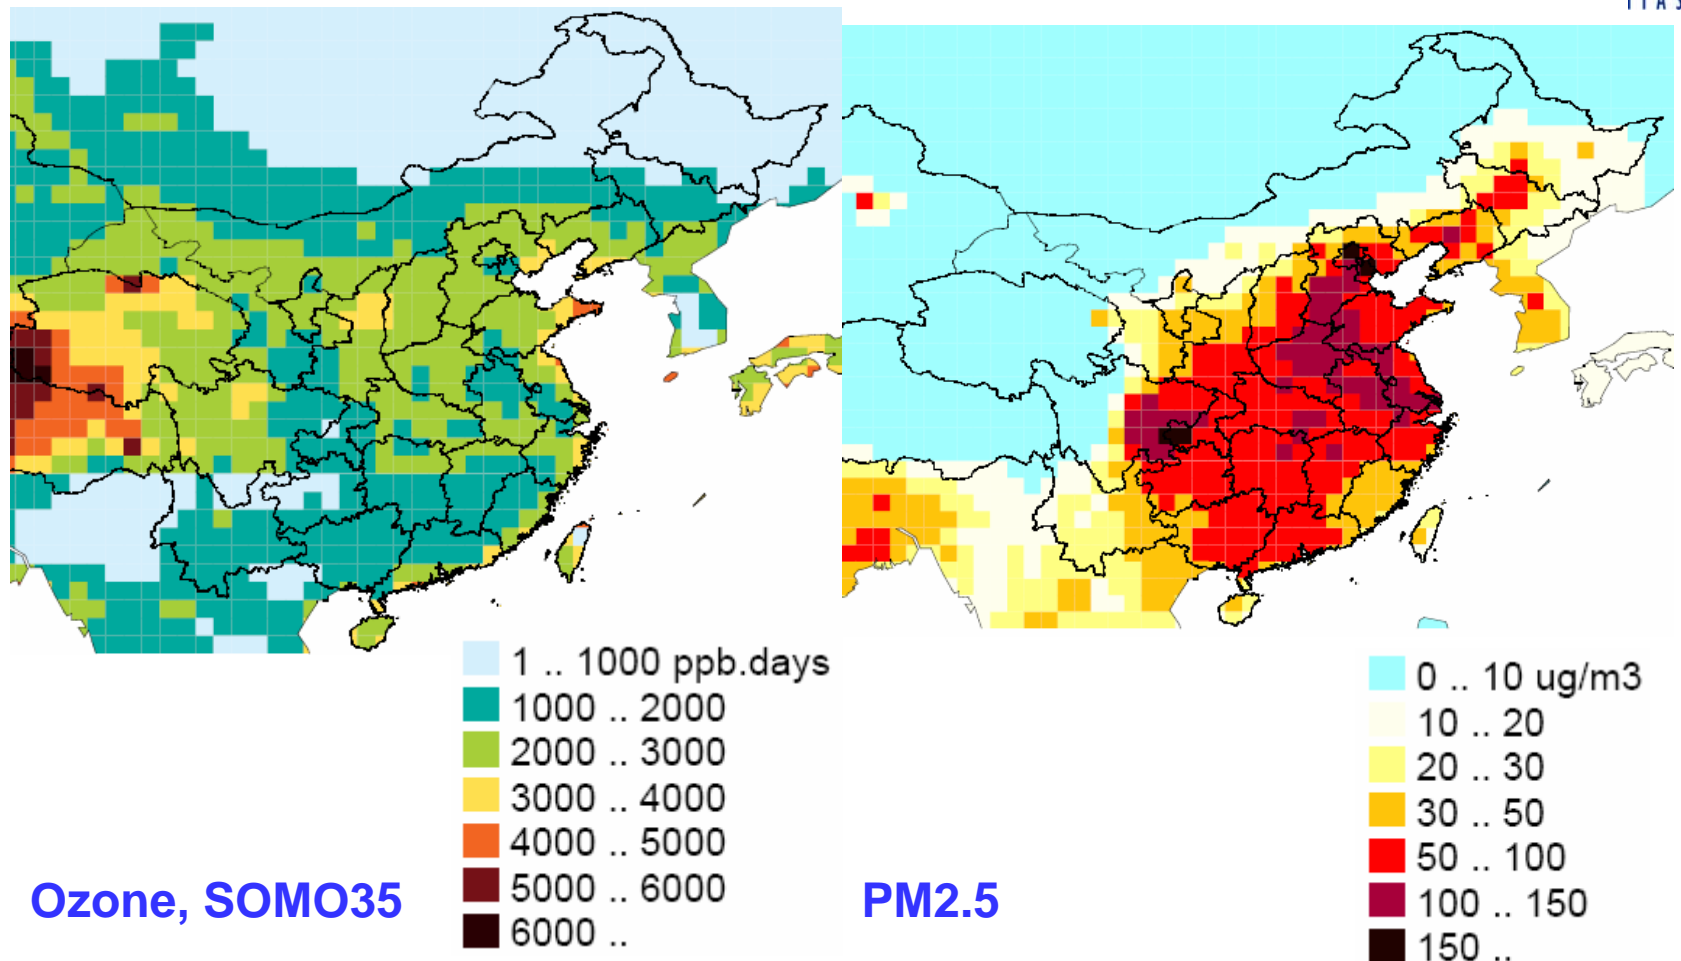

- TM5 calculates for each city the dispersion characteristic of an inert tracer (Rn222) based on vertical mixing
- This is then used by GAINS to compute the “urban increment” of PM2.5, linked to urban primary PM2.5 emissions from low level sources (domestic, transport, local industries)

Cost-effective allocation of end-of-pipe controls

Emissions, PM exposure and mitigation costs in 2020

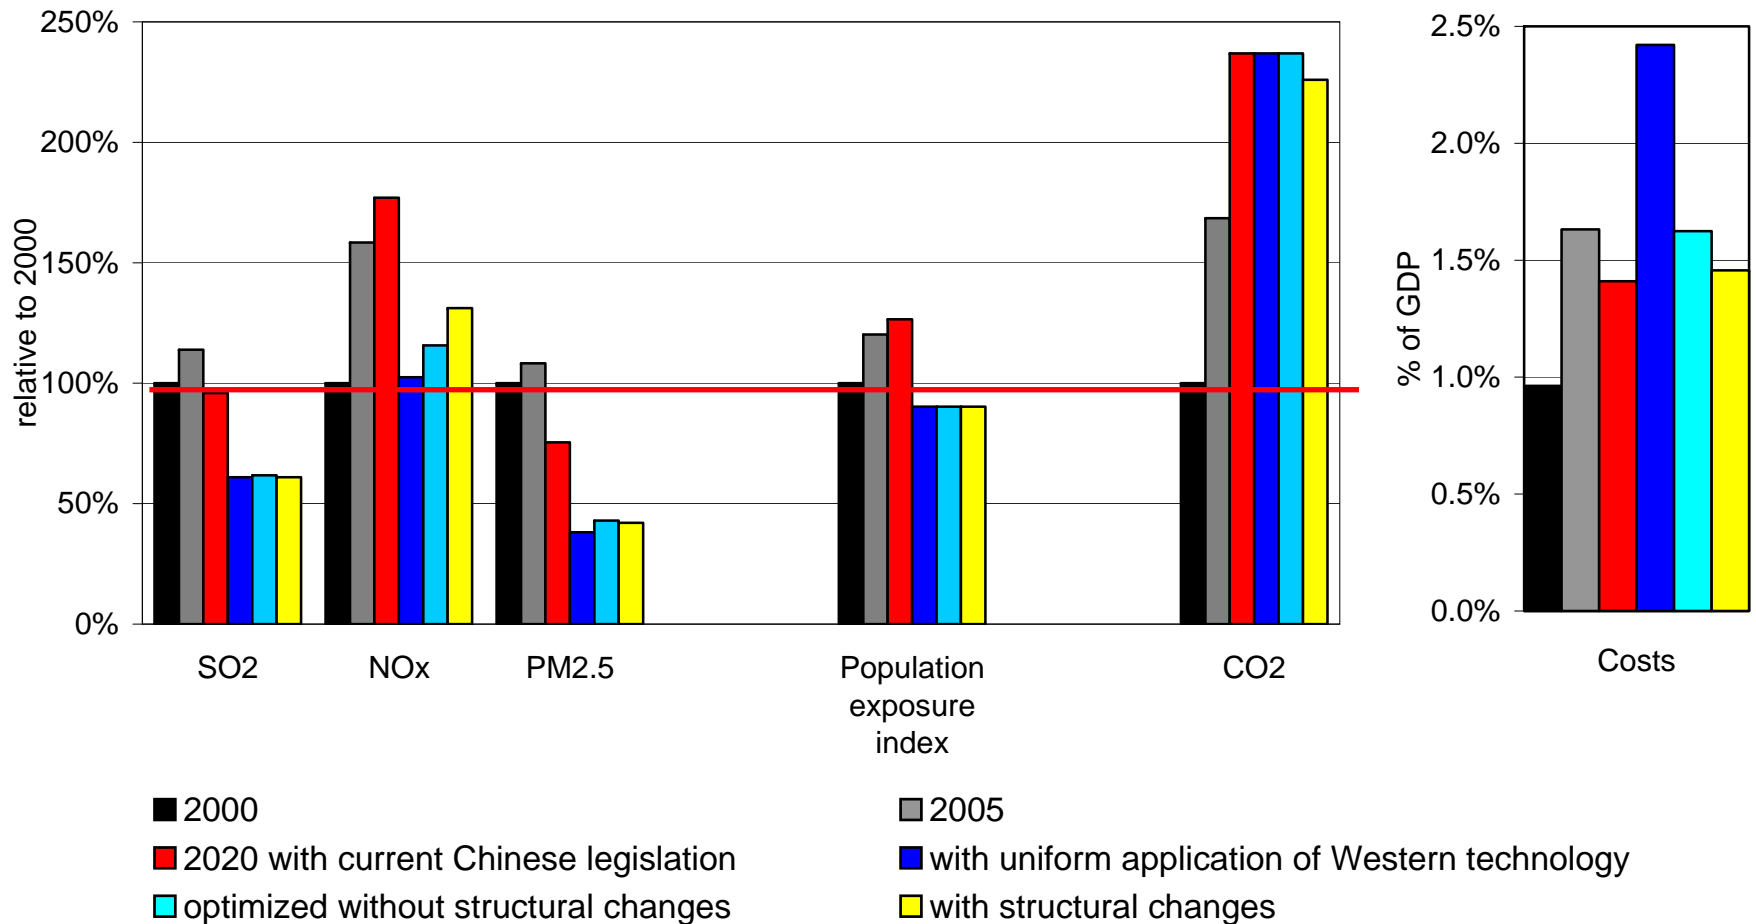

GAINS optimization for PM health targets allowing structural changes

- The GAINS optimization also allows modifications of the energy system:
 - increase in energy efficiencies,
 - fuel substitution (within province-specific limits),
 - clean coal technologies (IGCC),
 - phase-out of solid fuels in households, etc.
- Such measures have impacts on GHG emissions too.
- Example: Targets for air pollution as before (i.e., PM exposure index as in the Western technology scenario), but no targets for GHGs. Optimization considers structural measures in addition to end-of-pipe measures.

Cost-effective structural measures

Emissions, PM exposure and mitigation costs in 2020

Main cost-effective measures with synergies for air pollution control and GHG mitigation

- Efficiency improvements (for direct end-use and for electricity use)
- Combined heat and power generation
- Integrated Gasification Combined Cycle plants (IGCC)
- Phase-out of coal in the domestic sector
- Supply increased energy demand by natural gas instead of coal

Conclusions

- GAINS has now been implemented for Europe, China and India.
- TM5 is used for atmospheric calculations in Asia for PM2.5 and ozone. GAINS addresses now health impacts from PM2.5 in cities too.
- There are important measures with co-benefits for controlling air pollution and greenhouse gases. A low-CO₂ strategy can improve air quality at lower costs than conventional control measures.
- GAINS will be freely accessible on the Internet:
