PM2.5 concentrations in 2015, 2030 baseline, and 2030 mitigation potential

The current efforts will not be sufficient for reaching the AQ standards for 50% of Asian population

Summary

AIR POLLUTION IN ASIA AND THE PACIFIC: SCIENCE-BASED SOLUTIONS

Benefits of the Top 25 Measures on population exposure to PM2.5, emissions for climate forcers and other SDGs

Source: UNEP/CCAC, IIASA-GAINS model

Changes in pop weighted exposure due to packages of policies/measures

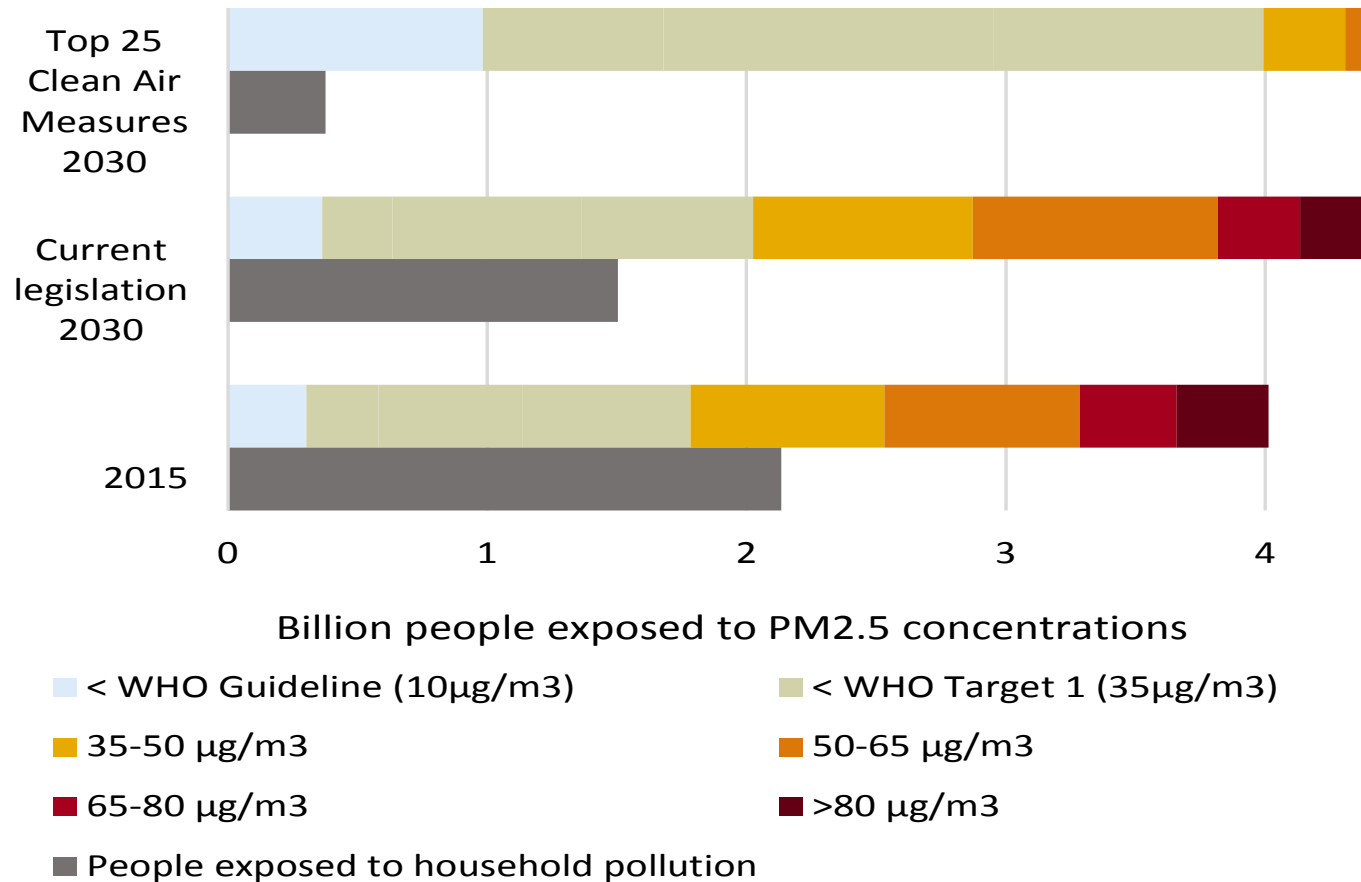

- Avoided by already implemented measures
- Top 25 measures
- From natural sources

- Avoided by compliance with recent legislation
- Remaining anthropogenic sources

Source: UNEP/CCAC, IIASA-GAINS model

The SDG portfolio could achieve the air quality standards for 90% of the Asian people

Villages adopted under PAMETI-UNEP project follows the advice

The farmers in the adopted villages of Bhoewali, Rajjian and Qiampur of Amritsar district under the PAMETI-UNEP Project are being regularly visited by the project staff and informed about the harmful effects of stubble burning.

The project team comprising of project fellow, Mr. Navjot S. Samra and demonstrators, Mr. Jagdip Singh and Mr. Gurinder Singh have also involved the print as well as electronic media in popularizing their extension activities. Also, the project staff has actively involved Department of Agriculture, Krishi Vigyan Kendra (KVK), Amritsar of PAU, Ludhiana and local farmers in carrying out the activities of the project. It is in this regard that the news about the events in the newspapers, both in English and vernacular language, are being covered regularly. The snapshots are as follows:

Straw burning: Ajnala villages show the way

TRIBUNA NEWS SERVICE

AMRITSAR, MAY 15 In a scenario where most of the farmers pay no heed to the appeals to shun burning of crop residue, three villages in Ajnala, adopted under a United Nations Environment Programme (UNEP) project, have to actively stopped the practice. The villages — Rajjan, Bhoewali and Qiam-pura — have been selected under the UNEP project termed 'Climate and clean air coalition to reduce short lived climate pollutants'. The project, which is being managed by Punjab Agricultural Management and Extension Training Institute (PAMETI), has adopted six villages in Punjab. The remaining three villages are in Sangrur. As most of the farmers prefer burning over alternative techniques, farmers at these villages have even made efforts that no fire from other villages spread to their farms. Navdeep Singh Samra, project fellow for the three villages, said, "It has been seen that instead of burning, farmers hope that fire

A farmer uses the machinery provided under the United Nations Environment Programme for management of crop residue in Amritsar. TRIBUNA NEWS SERVICE

from other farmers' fields spread to their farms and their purpose is solved without having the fear of being penalised. But here the farmers have made efforts to douse fire spreading from other villages too." Samra said that the biggest challenge was to change the mindset of the farmers. These villages have been provided with machinery and technical help under the UNEP project. Project head

Dr HS Dhalival said, "Apart from technical knowledge and machinery, we ran a series of awareness programmes in these villages. The walls in these villages have been painted with environment-friendly slogans. The efforts have been successful and we hope that farmers from other villages would emulate the efforts." Agriculture Engineer Ranbir Singh Randhawa said, "Though a few farmers in a

number of villages have stopped burning crop residue in the recent years, it is for the first time that three villages have stopped the practice entirely." Randhawa said the machinery and motivation provided to farmers had been of immense help as most of the marginal farmers couldn't purchase costly machinery. A change in the mindset of farmers is happening gradually with such efforts, he added.

Three villages say no to stubble burning

RURAL REVOLUTION Farmers of Bhoewali, Kiampur and Rajjian villages in Amritsar district are leading the way by using the straw to fertilise the soil, an innovation that doesn't cause pollution, helps save money and increases wheat yield

Am Sharma

Amritsar: Over the past few years as pollution levels have been reaching critical levels, the burning of stubble has become a major concern. In Punjab, the burning of stubble has become a major concern. In Punjab, the burning of stubble has become a major concern.

MODEL VILLAGES SHOW THE WAY

1,000 farmers covering 2,000 acres of land in the villages have stopped burning wheat crop stubble. Punjab agriculture department (PAET) team is encouraging farmers to stop the practice of burning stubble. The agriculture department has adopted six Punjab villages, three in Amritsar and three in Sangrur, to show them an model for farmers to emulate. The pilot project, a PAMETI initiative.

After convincing the stubble to the soil for two to three years, the farmers will not need any kind of fertilizer for the soil. In Amritsar, the agriculture department has selected the first two model villages. The first village is Bhoewali, where the farmers have had plenty of success in using the stubble as fertilizer. This is a good initiative, a model which will be implemented in the entire state, he added.

The department has also appointed three extension officers to visit these villages, to provide agricultural machinery to farmers to manage the stubble in Amritsar and Sangrur. "Small and marginal farmers are mostly affected," he said. "The department has also appointed three extension officers to visit these villages, to provide agricultural machinery to farmers to manage the stubble in Amritsar and Sangrur. "Small and marginal farmers are mostly affected," he said. "The department has also appointed three extension officers to visit these villages, to provide agricultural machinery to farmers to manage the stubble in Amritsar and Sangrur. "Small and marginal farmers are mostly affected," he said.

Not burning stubble for the last two years, Bhoewali farmers have stopped burning stubble this year, thanks to the agriculture department, which has provided them with the correct technique to use the stubble as fertilizer. This is a good initiative, a model which will be implemented in the entire state, he added.

Chief agriculture officer (CAO) Amritsar Dr. Hinder Singh Chahal said the department had provided funds and machinery free of cost to the farmers. "Those who are not burning stubble have not only increased their income by ₹30,000 to ₹1,00,000 per acre," he said.

MIXING STUBBLE WITH SOIL. The farmers of Bhoewali, Kiampur and Rajjan villages have agreed to implement the stubble as fertilizer. Once that's done the soil is

Dr. Dhaliwal from PAMETI reports results from CCAC-funded project in Punjab:

90% of farmers did NOT burn wheat residues in April-May 2018

When 75% of farmers DID burn wheat residues in April-May 2017

Agroecology means no burn.
No till.

Farmers need equipment,
like happy seeders.

Free/affordable financial
tools.

And solutions to impacts by
combines.

Alternatives to ↑ that
also yields.

Improve air quality.
Improve livelihoods.

Key selected findings

- More than 50% of Asian population face air quality exceeding the even the highest WHO standards
- We estimate that over 20% of premature deaths in Asia, and over 30% in South and Southeast Asia, are due to biomass combustion and open fires
- Effective enforcement of recent legislation will not be sufficient to reach present air quality standards in large areas, and will not reduce the number of people exposed to excess pollution
- The measures of the multi-sector scenario would attain the air quality standards for 90% of the Asian population
- In South and Southeast Asia, over 50% of the overall potential to reduce the population weighted PM2.5 exposure could be realized with measures addressing biomass combustion
- This will result in significant health improvements and other development benefits; short- and long-lived GHG emissions will be reduced as well
